CERTIFICATE

This is to certify that Mr. Nallathambi Shanmugavel Thever of S.Y. Information Technology (SYIT) Roll No. 2542048 has satisfactorily completed the Open Source DataBase Management System Mini Project Employee Performance Evaluation System entitled EMPLOYEE PERFORMANCE EVALUATION SYSTEM during the academic year 2025 – 2026, as a part of the practical requirement. The project work is found to be satisfactory and is approved for submission.

1. INTRODUCTION

An Employee Performance Evaluation System is a computerized, database-driven system designed to systematically record, manage, and analyze information related to employee performance within an organization. The primary purpose of this system is to assist management in assessing how well employees perform their assigned duties based on predefined evaluation criteria such as attendance, quality of work, productivity, punctuality, teamwork, and professional behavior.

In many organizations, employee performance evaluation is still carried out manually using paper-based records or basic, unstructured spreadsheet files. While these traditional methods may work for small organizations, they become increasingly inefficient as the number of employees grows. Manual evaluation processes are often time-consuming, require significant administrative effort, and are prone to human errors such as incorrect data entry, loss of records, and inconsistencies in evaluation standards. Additionally, retrieving historical performance data or generating performance reports can be difficult and slow when using manual systems.

A database-driven evaluation system provides a structured and efficient solution to these challenges. By storing employee performance data in a centralized database, organizations can ensure data accuracy, consistency, and easy access. The system allows authorized users to quickly enter, update, retrieve, and analyze employee performance records. It also supports better decision-making by enabling managers to identify high-performing employees, detect performance issues early, and plan training, promotions, or corrective actions based on reliable data.

MySQL is used as the Database Management System (DBMS) for this Employee Performance Evaluation System because it is open-source, cost-effective, reliable, and widely adopted in both academic and professional environments. MySQL provides strong support for Structured Query Language (SQL), which enables efficient data storage, retrieval, and manipulation. It also ensures data integrity and security through features such as primary keys, foreign keys, constraints, and user access control. Due to its scalability and compatibility with various programming languages and platforms, MySQL is well-suited for developing and managing employee performance evaluation systems.

2. PROBLEM DEFINITION

The existing employee evaluation process in many organizations is largely manual, unorganized, and inefficient. Performance records are commonly maintained using paper files or basic spreadsheet applications without a proper structure or centralized control. As a result, managing employee performance data becomes difficult, especially as the organization grows in size.

One of the major problems in the current system is data redundancy and duplication. The same employee information is often recorded multiple times in different files or formats, leading to unnecessary repetition of data. This not only wastes storage space but also increases the chances of conflicting information when updates are not applied consistently across all records.

Another significant issue is the difficulty in tracking employee performance over time. Manual systems do not provide an easy way to store historical performance data in an organized manner. Comparing past and present performance, identifying trends, or evaluating long-term employee growth becomes time-consuming and unreliable, making it harder for management to take informed decisions.

The lack of data security is also a serious concern in the existing system. Paper-based records and unsecured spreadsheets can be easily accessed, modified, lost, or damaged. There are usually no proper access controls or authentication mechanisms in place, which may lead to unauthorized access, data manipulation, or loss of sensitive employee information.

Additionally, report generation is time-consuming and inefficient. Preparing performance reports manually requires collecting data from multiple sources, verifying accuracy, and organizing it into readable formats. This process consumes valuable time and may delay important managerial decisions related to promotions, appraisals, or training requirements. There is also a high possibility of data inconsistency and errors in the manual evaluation process. Human errors such as incorrect data entry, calculation mistakes, missing records, or mismatched data are common. These inaccuracies can lead to unfair evaluations, employee dissatisfaction, and poor organizational planning.

Hence, to overcome these limitations, there is a strong need for a structured, database-driven Employee Performance Evaluation System. Such a system can centralize data storage, reduce redundancy, improve data accuracy, enhance security, and enable efficient tracking and reporting of employee performance. Implementing a database system will significantly improve the reliability, efficiency, and effectiveness of the employee evaluation process.

3. OBJECTIVES OF THE PROJECT

The objective of this project is to develop a **database-driven Employee Performance Evaluation System** that enables efficient storage, management, and analysis of employee performance data. The system is designed to overcome the limitations of manual evaluation methods by providing accuracy, consistency, and ease of access to performance information.

This project focuses on designing a structured database and implementing SQL operations to manage employee and evaluation records effectively. It also emphasizes maintaining data integrity, generating useful reports, and gaining practical exposure to MySQL database management.

The main objectives of the project are as follows:

- **To design a structured and efficient database**
To create a well-organized database schema that stores employee and performance evaluation data logically while reducing redundancy.
- **To store employee and evaluation details efficiently**
To maintain employee information, evaluation criteria, performance scores, and remarks in a centralized database for easy retrieval and management.
- **To implement SQL queries for data manipulation**
To use SQL commands for inserting, updating, and retrieving employee performance data accurately and efficiently.
- **To ensure data integrity and consistency**
To apply database constraints such as primary keys and foreign keys to prevent data duplication and maintain accuracy.
- **To generate performance reports for decision-making**
To produce meaningful performance reports that help management evaluate employee performance and support decisions related to promotions, training, and appraisals.
- **To gain practical experience in MySQL database management**
To develop hands-on skills in database design, SQL query execution, and real-world application of MySQL.

4. SCOPE OF THE PROJECT

The scope of the Employee Performance Evaluation System defines the boundaries and extent of the project. This system is designed to support organizations in managing employee performance data efficiently using a structured, database-driven approach. The project mainly focuses on database design and data management rather than user interface development.

The system provides a centralized database that stores employee details, evaluation criteria, performance ratings, and related records. It supports authorized users in recording, updating, and analyzing employee performance information in a secure and organized manner. The scope of this project is limited to database operations using MySQL and does not include frontend or application-level development.

Users of the System

The system is intended to be used by different categories of users within an organization, each with specific roles and responsibilities:

- **Admin / HR Manager**
The Admin or HR Manager is responsible for managing employee records, defining evaluation criteria, entering performance data, and maintaining the overall database. They have full access to the system for data insertion, modification, and report generation.
- **Supervisors**
Supervisors are responsible for evaluating employees under their supervision. They can record performance ratings, provide feedback, and view performance history of employees within their department.
- **Management**
Management users primarily access performance reports and summaries. These reports help them analyze employee productivity, identify high-performing employees, and support decision-making related to promotions, training, and appraisals.

Usage Areas

The Employee Performance Evaluation System can be effectively used in various organizational environments, including:

- **Corporate organizations**
To evaluate employee performance systematically and maintain accurate performance records for appraisal and human resource planning.
- **Small and Medium Enterprises (SMEs)**
To manage employee evaluations in a structured manner without relying on complex or costly systems.
- **Educational institutions**
To evaluate teaching and non-teaching staff based on predefined performance criteria such as attendance, work quality, and overall contribution.

Limitations of the Project

While the system provides an efficient database solution for employee performance evaluation, it has certain limitations:

- **Focuses only on database design**

The project concentrates on designing and implementing the MySQL database and SQL queries without developing a graphical user interface.

- **No web or mobile interface included**

The system does not include a web-based or mobile application for user interaction; all operations are performed at the database level.

- **Predefined performance ratings**

The performance evaluation criteria and rating scales are fixed and cannot be dynamically modified within the scope of this project.

In conclusion, the scope of this project is limited to the development of a reliable and structured database system that supports employee performance evaluation. Despite its limitations, the system provides a strong foundation that can be extended in the future with user interfaces, automation, and advanced analytics.

5. REQUIREMENT SPECIFICATION

This section describes the hardware and software requirements needed to develop and run the Employee Performance Evaluation System.

5.1 Hardware Requirements

The following hardware components are required for the implementation of the system:

- Computer / Laptop – Used for development and execution of the database system
- Minimum 4 GB RAM – Required for smooth operation of MySQL Server and Workbench
- Minimum 20 GB Free Storage – Required for database storage, backups, and system files

5.2 Software Requirements

The following software tools are required for the development and execution of the system:

Software	Purpose
MySQL Server	Database management
MySQL Workbench	Query execution and database administration
Operating System	Windows / Linux
SQL	Query language for database operations

These hardware and software requirements ensure the proper functioning, performance, and reliability of the Employee Performance Evaluation System.

6. SYSTEM DESIGN

6.1 System Architecture

The Employee Performance Evaluation System follows a **simple and efficient database-driven architecture**. The conceptual flow of the system is described below:

- **Admin Interaction**
The Admin or HR Manager interacts with the system by executing SQL queries to insert, update, and retrieve employee performance data.
- **Query Processing**
All SQL queries are processed by the MySQL Server, which handles data validation, execution, and response generation.
- **Data Storage and Retrieval**
Employee details and performance evaluation records are stored in well-structured database tables, ensuring organized data management and easy retrieval.
- **Output Presentation**
The results of executed queries are displayed in a clear **tabular format**, allowing easy interpretation and analysis of employee performance information.
- **System Efficiency and Security**
This architecture ensures fast data processing, maintains data integrity through structured tables and constraints, and provides secure database operations.

7. DATABASE DESIGN

7.1 Entity Description

Employee

The Employee entity stores personal and job-related information of employees working in the organization. It includes details such as employee identification number, name, designation, department, and date of joining. This entity is central to the system, as employee performance evaluations are associated with individual employees.

Department

The Department entity stores information related to various departments within the organization. It includes department identification number and department name. This entity helps in categorizing employees based on their departments and supports department-wise performance analysis.

Evaluation

The Evaluation entity stores performance evaluation records of employees. It contains details such as evaluation ID, performance score, remarks, evaluation date, and references to the employee and evaluator involved. This entity plays a key role in tracking and analyzing employee performance over time.

Evaluator

The Evaluator entity stores details of managers or supervisors responsible for evaluating employee performance. It includes evaluator identification number, name, and role. This entity ensures that each performance evaluation is conducted and recorded by an authorized evaluator.

This entity structure provides a clear and organized representation of the data required for the Employee Performance Evaluation System.

7.2 Table Structure

The database of the Employee Performance Evaluation System consists of the following tables:

Employee Table

This table stores basic and job-related information of employees.

Attribute Name	Data Type	Description
Employee_ID	INT	Primary Key, uniquely identifies each employee
Employee_Name	VARCHAR	Stores the name of the employee
Department_ID	INT	Foreign Key, references Department table
Designation	VARCHAR	Stores employee designation
Date_Of_Joining	DATE	Stores employee joining date

Department Table

This table stores details of departments within the organization.

Attribute Name	Data Type	Description
Department_ID	INT	Primary Key, uniquely identifies each department
Department_Name	VARCHAR	Stores the department name

Evaluator Table

This table stores information about evaluators or supervisors.

Attribute Name	Data Type	Description
Evaluator_ID	INT	Primary Key, uniquely identifies each evaluator
Evaluator_Name	VARCHAR	Stores evaluator name
Role	VARCHAR	Stores evaluator role or designation

Evaluation Table

This table stores employee performance evaluation details.

Attribute Name	Data Type	Description
Evaluation_ID	INT	Primary Key, uniquely identifies each evaluation record
Employee_ID	INT	Foreign Key, references Employee table
Evaluator_ID	INT	Foreign Key, references Evaluator table
Performance_Score	INT	Stores employee performance score
Remarks	VARCHAR	Stores evaluation remarks
Evaluation_Date	DATE	Stores date of evaluation

7.3 Constraints Used

Constraints are used to maintain data integrity and consistency in the database.

- **PRIMARY KEY**
Ensures that each record in a table is uniquely identified and prevents duplicate entries.
- **FOREIGN KEY**
Maintains relationships between tables and ensures referential integrity between related records.
- **NOT NULL**
Ensures that mandatory fields always contain values and cannot be left empty.
- **UNIQUE**
Prevents duplicate values in specific columns and maintains data uniqueness.

This structured database design ensures accurate data storage, efficient retrieval, and reliable employee performance evaluation

9. SQL Implementation

-- 9.1 Database Creation

```
CREATE DATABASE EmployeeEvaluation;  
USE EmployeeEvaluation;
```

-- 9.2 Table Creation

```
CREATE TABLE Department (  
    Department_ID INT PRIMARY KEY,  
    Department_Name VARCHAR(50) NOT NULL  
);
```

```
CREATE TABLE Employee (  
    Employee_ID INT PRIMARY KEY,  
    Employee_Name VARCHAR(50) NOT NULL,  
    Department_ID INT,  
    Designation VARCHAR(50),  
    Date_Of_Joining DATE,  
    FOREIGN KEY (Department_ID) REFERENCES Department(Department_ID)  
);
```

```
CREATE TABLE Evaluator (  
    Evaluator_ID INT PRIMARY KEY,  
    Evaluator_Name VARCHAR(50) NOT NULL,  
    Role VARCHAR(50)  
);
```

```
CREATE TABLE Evaluation (  
    Evaluation_ID INT PRIMARY KEY,  
    Employee_ID INT,  
    Evaluator_ID INT,  
    Performance_Score INT CHECK (Performance_Score BETWEEN 0 AND 100),  
    Remarks VARCHAR(100),  
    Evaluation_Date DATE,  
    FOREIGN KEY (Employee_ID) REFERENCES Employee(Employee_ID),  
    FOREIGN KEY (Evaluator_ID) REFERENCES Evaluator(Evaluator_ID)  
);
```

-- 9.3 Data Insertion

-- Insert into Department

```
INSERT INTO Department VALUES  
(1, 'HR'),  
(2, 'IT'),  
(3, 'Finance'),  
(4, 'Marketing'),  
(5, 'Operations');
```

-- Insert into Employee

```
INSERT INTO Employee VALUES  
(101, 'Rahul Sharma', 1, 'Manager', '2021-06-10'),  
(102, 'Anita Verma', 2, 'Developer', '2022-03-15'),  
(103, 'Karan Mehta', 3, 'Accountant', '2020-11-20'),  
(104, 'Pooja Singh', 4, 'Marketing Executive', '2023-01-05'),  
(105, 'Neha Patel', 5, 'Operations Officer', '2019-08-18');
```

-- Insert into Evaluator

```
INSERT INTO Evaluator VALUES
(201, 'Amit Singh', 'HR Manager'),
(202, 'Ravi Kumar', 'Senior Manager'),
(203, 'Sunita Rao', 'Department Head'),
(204, 'Manoj Gupta', 'Team Lead'),
(205, 'Priya Nair', 'HR Executive');
```

```
-- Insert into Evaluation
INSERT INTO Evaluation VALUES
(301, 101, 201, 85, 'Very Good', '2024-01-10'),
(302, 102, 202, 90, 'Excellent', '2024-01-12'),
(303, 103, 203, 78, 'Good', '2024-01-15'),
(304, 104, 204, 88, 'Very Good', '2024-01-18'),
(305, 105, 205, 92, 'Outstanding', '2024-01-20');
```

-- 9.4 Data Retrieval

```
SELECT Employee_Name, Performance_Score
FROM Employee
JOIN Evaluation ON Employee.Employee_ID = Evaluation.Employee_ID;
```

-- 9.5 Advanced Queries

```
-- GROUP BY
SELECT Department_ID, COUNT(Employee_ID) AS Total_Employees
FROM Employee
GROUP BY Department_ID;
```

```
-- HAVING
SELECT Department_ID, COUNT(Employee_ID) AS Total_Employees
FROM Employee
GROUP BY Department_ID
HAVING COUNT(Employee_ID) > 1;
```

```
-- Subquery
SELECT Employee_Name
FROM Employee
WHERE Employee_ID IN (
    SELECT Employee_ID
    FROM Evaluation
    WHERE Performance_Score > 80
);
```

```
-- View Creation
CREATE VIEW Performance_View AS
SELECT Employee_Name, Performance_Score
FROM Employee
JOIN Evaluation ON Employee.Employee_ID = Evaluation.Employee_ID;
```

GANTT CHART

The Gantt Chart illustrates the project schedule and time distribution for the development of the Employee Performance Evaluation System. It clearly represents the sequence of activities such as requirement analysis, database design, ER diagram design, table creation, SQL implementation, system testing, and documentation.

Each task is assigned a specific duration and arranged in a logical order to ensure smooth workflow and timely completion of the project. The chart helps in monitoring progress, managing time effectively, and ensuring that the project is completed within the planned schedule.

- The Gantt Chart represents the timeline and overall schedule of Employee Performance Evaluation System project.
- It shows the sequence of development phases including requirement analysis, database design, ER diagram design, table creation, SQL implementation, system testing, and documentation.
- Each activity is assigned a specific duration to ensure systematic and organized project execution.
- The chart helps in tracking project progress and monitoring task completion at every stage.
- It ensures effective time management and timely submission of the project.

10. SYSTEM TESTING AND RESULT

(Employee Performance Evaluation System)

System testing was performed to ensure that the Employee Performance Evaluation System functions correctly and produces accurate results. All database operations were tested using MySQL Workbench to verify correctness, reliability, and data integrity.

10.1 Query Testing

All essential SQL queries were tested to verify the correctness of database operations. The following types of queries were executed:

- **DDL Queries (CREATE, DROP) to test database and table creation**
- **DML Queries (INSERT, UPDATE, DELETE) to test data manipulation**
- **DQL Queries (SELECT) to retrieve and analyze data**

Each query was tested using:

- **Valid inputs to ensure correct execution**
- **Invalid inputs to check error handling and constraint enforcement**

All queries executed successfully and returned the expected results. This confirmed that the database schema, relationships, and query logic were implemented correctly and functioned as designed.

1. Database and Table Creation Testing

Database and Table Creation Testing is performed to verify that the database and all required tables are created successfully without errors. This testing ensures that the database structure is correctly defined before inserting or retrieving any data.

Actual Result

The database EmployeeEvaluation (Department, Employee, Evaluator, Evaluation) were created successfully.

Department Table

	Department_ID	Department_Name
▶	1	HR
	2	IT
	3	Finance
	4	Marketing
	5	Operations
✱	NULL	NULL

2. Join Query

Data Retrieval

```
SELECT Employee_Name, Performance_Score
FROM Employee
JOIN Evaluation ON Employee.Employee_ID = Evaluation.Employee_ID;
```

Result Outcome

- The query executed successfully without any errors.
- Data was retrieved from the Employee and Evaluation tables.
- The output displayed the following details:
 - Employee Name
 - Performance Score
- The JOIN operation correctly linked the tables using the Employee_ID attribute.
- The retrieved results accurately matched the data stored in the database.
- This confirms that the table relationships and JOIN logic in the Employee Performance Evaluation System are functioning correctly.

Employee Table

	Employee_ID	Employee_Name	Department_ID	Designation	Date_Of_Joining
▶	101	Rahul Sharma	1	Manager	2021-06-10
	102	Anita Verma	2	Developer	2022-03-15
	103	Karan Mehta	3	Accountant	2020-11-20
	104	Pooja Singh	4	Marketing Executive	2023-01-05
	105	Neha Patel	5	Operations Officer	2019-08-18
•	NULL	NULL	NULL	NULL	NULL

3. View Creation

```
CREATE VIEW Performance_View AS
SELECT Employee_Name, Performance_Score
FROM Employee
JOIN Evaluation ON Employee.Employee_ID = Evaluation.Employee_ID;
```

Result Outcome:

- The view Performance_View was created successfully without any errors.
- The view stores combined data from the Employee and Evaluation tables.
- It displays the following information:
 - Employee Name
 - Performance Score
- The view simplifies data access by eliminating the need to write complex JOIN queries repeatedly.
- Querying the view returns accurate and up-to-date performance data based on the underlying tables.
- This confirms that the VIEW creation and table relationships in the database are working correctl

	Field	Type	Null	Key	Default	Extra
▶	Department_ID	int	NO	PRI	NULL	
	Department_Name	varchar(50)	NO		NULL	

10.2 Constraint Validation

Database constraints such as **Primary Key**, **Foreign Key**, **NOT NULL**, and **UNIQUE** were tested to validate data integrity.

- Primary key constraints prevented duplicate records.
- Foreign key constraints ensured proper relationships between tables.
- NOT NULL constraints restricted empty values in mandatory fields.

These constraints ensured that only valid and consistent data was stored in the database.

10.3 Sample Output Verification

Sample data was inserted into all tables, and multiple SELECT queries were executed to retrieve employee and performance information. The retrieved outputs were compared with the inserted data and were found to be accurate and consistent.

JOIN queries successfully combined data from multiple tables and displayed meaningful employee performance details.

10.4 Report Generation Result

Performance reports were generated using SELECT queries, JOIN operations, and views. The reports accurately displayed employee names, departments, evaluation scores, and remarks.

Aggregate queries helped analyze performance data effectively.

The results confirmed that the system can generate reliable and accurate employee performance records for decision-making purposes.

Final Result

The testing process confirmed that the Employee Performance Evaluation System works efficiently and meets all project objectives. The system maintains data integrity, ensures accurate data processing, and produces correct performance evaluation results.

	Field	Type	Null	Key	Default	Extra
▶	Employee_ID	int	NO	PRI	NULL	
	Employee_Name	varchar(50)	NO		NULL	
	Department_ID	int	YES	MUL	NULL	
	Designation	varchar(50)	YES		NULL	
	Date_Of_Joining	date	YES		NULL	

11. SECURITY, BACKUP AND RECOVERY

(Employee Performance Evaluation System)

Security, backup, and recovery are essential aspects of any database system. In the Employee Performance Evaluation System, these mechanisms ensure data protection, prevent unauthorized access, and allow data restoration in case of failure.

11.1 Security

Database security is implemented to protect sensitive employee and performance data from unauthorized access.

User Privileges

MySQL provides user privilege management using the **GRANT** and **REVOKE** commands. Different users are assigned specific permissions based on their roles.

- Administrators are granted full access to the database.
- Regular users are allowed limited access such as viewing records.
- Unauthorized users are restricted from modifying sensitive data.

This role-based access control ensures that only authorized users can perform critical database operations.

Restricted Access

Access to sensitive data such as performance scores and evaluation remarks is restricted. Only authorized personnel such as administrators and evaluators can view or update this information. This prevents misuse, data tampering, and ensures confidentiality.

11.2 Backup

Database backup is necessary to prevent data loss due to system failure, accidental deletion, or hardware issues.

Database Backup Using mysqldump

MySQL provides the **mysqldump** utility to create a complete backup of the database. It exports the database structure and data into a SQL file.

Regular backups ensure that all employee and evaluation records are safely stored and can be restored when required.

11.3 Recovery

Recovery refers to restoring the database from backup files in case of data loss or system failure.

Data Restoration

The backup SQL file generated using **mysqldump** can be used to restore the database. During recovery, the database structure and data are recreated exactly as they were at the time of backup.

This process ensures business continuity and minimizes data loss.

Conclusion

The implementation of security, backup, and recovery mechanisms ensures that the Employee Performance Evaluation System is secure, reliable, and fault-tolerant. Proper access control protects sensitive data, while backup and recovery mechanisms ensure data availability and system reliability.

12. FUTURE SCOPE AND CONCLUSION

(Employee Performance Evaluation System)

Future Scope

The Employee Performance Evaluation System can be further improved by adding new features and technologies in the future.

- **Web-based Interface:**
The system can be converted into a web-based application so that users can access it through a web browser. This will make the system more user-friendly and allow remote access.
- **Automated Performance Analytics:**
Performance analytics can be added to automatically analyze employee data. This will help in identifying high-performing employees and understanding performance trends without manual effort.
- **Graphical Reports:**
Graphical reports such as bar charts and pie charts can be included to visually represent employee performance. This will make reports easier to understand and support better decision-making.
- **Integration with Payroll Systems:**
The system can be integrated with payroll systems so that performance evaluations can be directly linked to salary increments, bonuses, and incentives.

Conclusion

The Employee Performance Evaluation System successfully demonstrates the use of MySQL for managing employee performance data in a structured and efficient manner. The project helped in understanding important database concepts such as database design, SQL queries, table relationships, and data integrity constraints.

This system provides a practical and reliable solution for storing, retrieving, and analyzing employee performance records. Overall, the project highlights the importance of database management systems in performance management and forms a strong base for developing advanced employee management applications in the future.

13. REFERENCES

MySQL Official Documentation:

The official MySQL documentation was referred to for learning SQL syntax, database creation, table structures, constraints, transaction management, and query execution. It provided accurate and detailed information about MySQL features, commands, and functions used in this project.

Website: <https://dev.mysql.com/doc/>

Prescribed Textbooks:

Academic textbooks related to Database Management Systems (DBMS) were used to understand theoretical concepts such as relational database models, normalization, primary and foreign keys, constraints, entity relationships, and database design principles.

Online Learning Sources:

Various online tutorials, educational websites, and learning platforms were used to understand the practical implementation of SQL queries and MySQL Workbench. These resources helped in learning joins, GROUP BY clauses, views, aggregate functions, and transaction commands used in the Restaurant Order and Billing Management System.

Examples:

- www.w3schools.com
- www.geeksforgeeks.org
- www.tutorialspoint.com

College Study Materials and Notes:

Lecture notes, classroom demonstrations, practical sessions, and guidance provided by faculty members were also referred to during the development of the Restaurant Order and Billing Management System.

14: GLOSSARY

The glossary section provides simple meanings of important terms used throughout the Office Asset Management project. These terms are related to database systems and SQL concepts that are essential to understand how the project works. The definitions are written in easy language so that readers with basic or no prior knowledge of databases can understand them clearly. This section helps remove confusion and acts as a quick reference for technical words used in the documentation.

- **DBMS (Database Management System):**

A DBMS is software that is used to store, manage, and retrieve data in an organized way. It allows users to handle large amounts of data efficiently and securely.

- **SQL (Structured Query Language):**

SQL is a standard language used to communicate with a database. It is used to create tables, insert data, retrieve records, and manage database operations.

- **Primary Key:**

A primary key is a field that uniquely identifies each record in a table. It ensures that no two records have the same value.

- **Foreign Key:**

A foreign key is a field that connects one table to another table. It helps maintain relationships and data consistency between tables.

- **MySQL:**

MySQL is an open-source relational database management system used to create and manage databases. It is widely used because it is reliable, easy to use, and supports all basic database features.
